Section 1: What Live Interrupt is

Assess IQ Live Interrupt is the live stamp on Assess IQ. A camera is on the job. Assess IQ already compares the governed plan to what is happening in front of the worker. Live Interrupt turns that score into an instant Stop, Continue, or Call the supervisor so someone can be helped before the job goes wrong.

That is the whole product, said in one breath. The camera is already paid for. The score is already computed. The missing piece was a decision at the speed of the job — a typed choice, with confidence, cheap enough to run on every observation. Live Interrupt is that decision. Lives depend on it. That speed is the point.

Stop means halt the next action the instant the score says the job has left the plan. Continue means release the next action when the plan and the picture agree and confidence is high enough to keep the crew moving. Call the supervisor means bring a human to the job the moment the score asks for help. Those three options are the options you defined. The stamp picks among them. The person on the tool is helped in time.

Section 2: Why speed on Assess IQ

Assess IQ already owns the most valuable second on a plant: the second when the written procedure and the live picture part company. Until Live Interrupt, that second became a report. A discrepancy landed after the shift. A supervisor read it in the morning. The person who needed help had already finished the job — or had already been hurt.

Speed on Assess IQ is how a score becomes help. The glasses are on. The camera is rolling. Genesis has the step. Permit IQ has the flags. Tacit has the expert's sentence. Frontier or Gemini has captioned this photo. Assess IQ has the gap. Live Interrupt has one job: stamp Stop, Continue, or Call the supervisor before the wrench turns.

Oil and gas work is won and lost in those seconds. A lock that is not on V-204. A fire watch who has stepped away. A gas reading that no longer matches the permit. A line that is the wrong line. Every one of those moments is already an Assess IQ observation. Live Interrupt makes that observation decisive while the crew is still on the unit.

Supervisor leverage follows the same clock. High-confidence continues to keep good work moving. The calls that need a human arrive as Call the supervisor, with the scrap of paper already packed. One experienced supervisor covers more jobs, with better timing, because Assess IQ has already decided at job speed.

Section 3: How Jev delivers the snap

Jev is how Assess IQ decides at the speed of the job. Jev is TypeSafe System One — the Jev-class decision model built for typed, confidence-aware judgments. Shared state goes

in. A typed Stop, Continue, or Escalate comes out, with a probability distribution and a confidence the product can trust. A typical call lands in tens to a few hundred milliseconds.

This is why Jev matters for Assess IQ. Assess IQ already scores every observation. A live camera loop produces many scores a minute. The stamp on each score must be typed, cheap, and fast. Jev is built for exactly that shape of work. It answers the questions you wrote. It returns only the options you defined. It reports how sure it is. Code — the Assess IQ product — owns the thresholds that turn that confidence into Stop, Continue, or Call the supervisor.

3.1 What Jev receives

- The active Genesis SOP step, in the plant's own words.
- Permit IQ flags already on the job — gas, fire watch, validity, hold points.
- Code checks the plant already computes — lock counts, limits, tag matches.
- A Tacit quote when the expert's living memory is relevant to this step.
- A Frontier or Gemini caption of this photo — what the camera sees, now.

3.2 What Jev returns

- A typed choice: Stop, Continue, or Escalate.
- A confidence the product can threshold in code.
- Optional Booleans and scores on the safety questions you asked in the same call.

One call can carry many typed questions. Assess IQ packs the paper once. Jev answers the set. The product applies the thresholds. The worker sees Stop, Continue, or Call the supervisor. The record is written. That is the snap.

Section 4: Fact sources — we only decide from what the plant already knows

Trust at job speed is a quality story. Live Interrupt decides only from facts the plant already holds. The scrap of paper is copied truth. Each line on that paper has a home in a product the customer already runs. Nothing on the paper is invented for the stamp.

Fact on the paper	Where it already lives	Why the stamp can trust it
Genesis SOP step	Genesis — the scored procedure	The real words of the job, already governed.
Permit IQ flags	Permit IQ — authority and controls	Gas, fire watch, validity, hold points — already structured.
Code checks	Plant logic Assess IQ already runs	Counts, limits, and lock tallies the code already computes.
A Tacit quote	Tacit — the expert's living memory	The expert's own sentence, retrieved when it is relevant.
Frontier / Gemini caption	Field IQ camera on this job	A caption of this photo.

		Observation only. Ready for the stamp.
--	--	--

This is how quality is designed in. The stamp is only as good as the paper. The paper is only as good as the products that already run the plant. Genesis, Permit IQ, Field IQ, Tacit, and Assess IQ write the truth they already own. Jev reads that paper and returns a typed choice. We only decide from what the plant already knows.

Section 5: Confidence — high acts, unsure interrupts

Confidence is how Live Interrupt stays honest at millisecond speed. Jev returns a calibrated confidence with every typed choice. Assess IQ owns the thresholds in code. High confidence becomes Continue or Stop, according to the score. Unsure confidence becomes an interrupt and a supervisor call.

That rule is a sales promise and a safety design. A sure Continue keeps a competent crew moving. A sure Stop protects the person on the tool. An unsure moment is the moment a human is most valuable. Live Interrupt spends supervisor attention where it pays — on the jobs that asked for help.

- High confidence → Assess IQ acts on the typed choice.
- Unsure confidence → Live Interrupt stops the next action and escalates a supervisor.
- Every stamp, every confidence, and every override is written to Work Intelligence and EON Control.

The worker always sees a clear instruction. The supervisor always receives a packed paper — the step, the flags, the caption, the Tacit quote, the confidence. The plant always keeps the record. Confidence is how a fast system earns the right to be fast.

Section 6: How the products hang together

Live Interrupt is a station of the Intelligence Flywheel. It sells as the live decision on the Assess IQ score, and it is stronger because the family is already on the job.

Product	What it contributes to the live stamp
Genesis	The plan — the scored procedure the job is measured against.
Permit IQ	Authority and controls — gas, fire watch, validity, hold points.
Field IQ	Eyes on the job — glasses, cameras, and the live work face.
Tacit	The expert's living memory, quoted on the paper when it is relevant.
Assess IQ + Live Interrupt	Scores plan versus reality, then stamps Stop, Continue, or Call the supervisor on that score.
Compound IQ / Distillery	Every interrupt and every override makes the next job sharper.
Work Intelligence / EON Control	The record — every observation, every stamp,

	every override, on the ledger.
--	--------------------------------

The completed loop is the Human 2.0 OS. Genesis writes the plan. Field IQ watches. Assess IQ scores. Live Interrupt decides. Compound IQ and Distillery learn. Work Intelligence remembers. The next job arrives sharper than the last.

Section 7: Outcomes

- Human help at incident speed — a Stop or a supervisor call while someone can still be helped.
- Job-speed Continues — competent work keeps moving when the plan and the picture agree.
- Supervisor leverage — humans take the calls that need them; one supervisor covers more live jobs.
- A trusted paper — decisions drawn only from Genesis, Permit IQ, code checks, Tacit, and this photo’s caption.
- A compounding record — every interrupt and override feeds Compound IQ and Distillery, and lands on EON Control.
- A Jev-class snap on every observation — typed, confident, inexpensive, and fast enough for a live camera.

These outcomes are why Live Interrupt is released now. The ability to help a person before a job goes wrong is the commercial offer and the moral offer. Customers in oil and gas already run the cameras and already score the jobs. The stamp is how those investments become lives saved and shifts completed.

Section 8: Availability

Assess IQ Live Interrupt is available now through EON’s 90-day Human 2.0 Engagement (H2O) and the Field IQ cohort. Customers receive the live stamp on Assess IQ, Jev-class snap decisions on every scored observation, and the fact-source paper described in this document. A working demonstration follows quickly. Briefings with the Office of the Chairman begin this week.

The story ships today because lives depend on the interrupt. Teams that already run Field IQ and Assess IQ can put Live Interrupt on the camera they already own. The Office of the Chairman will walk the briefing, the press release, and this paper with editors, analysts, anchor customers, and partners on request.

Section 9: Close from the Office of the Chairman

Field work has always had a second that mattered more than the rest of the shift. Assess IQ already sees that second. Live Interrupt decides it. Jev is the snap that makes the decision fast enough, typed enough, and honest enough to run on every frame. The family around it — Genesis, Permit IQ, Field IQ, Tacit, Compound IQ, Distillery, Work Intelligence, and EON Control — writes the paper, watches the job, and keeps the record.

Help them before it goes wrong. That is the product. That is why this paper is a companion to Assess IQ and Field IQ. That is why the Office of the Chairman is releasing it now.
